
Trawl

Product roadmap to general availability

On the name: a trawl is a net drawn slowly through deep water to bring up what lies below. Trawl reads policy language the same way, surfacing what is worth seeing.

WHAT TRAWL IS

Trawl reads insurance policy language clause by clause.

It returns a structured, reshapeable read, anchored to the language:

gaps broad exclusions closer looks strengths

TWO OUTPUTS

- HTML

Interactive export: a like-for-like HTML mirror of the running read, essentially a data-visualization dashboard. Gated behind a pending paywall; it ships as a paid capability.
- PDF

Assessment: a board-ready PDF for a client or board conversation.

RUNNING READ

lens

risk

finance

legal

POSSIBLE GAP

Cover the insured would expect that the language may not provide.

e.g. Notice provision may require reporting inside the policy period only.

BROAD EXCLUSION

An exclusion drafted wider than its purpose, cutting into cover.

e.g. Contractual-liability carve-out reaches beyond assumed obligations.

CLOSER LOOK

Language whose effect is ambiguous and worth confirming before bind.

e.g. Definition of Claim is narrower than the insuring agreement implies.

STRENGTH

A provision that works in the insured's favor.

e.g. Defense costs sit outside the limit, preserving indemnity.

BUILT-IN CONVERSION FUNNEL: FROM READ TO ENGAGEMENT

* The portal handoff requires explicit opt-in before any detail is shared, and your inputs are used only to generate your read.

WHERE WE ARE TODAY

Invite-only preview, three lines live

ACCESS Invite-only. Passwordless OTP against an allow-list. The chooser card is gated by an internal cookie; sign-in is an email plus a one-time code.	LINES LIVE Cyber, Technology E&O, Miscellaneous Professional Liability. The lab takes short clauses and questions, not whole policies.	SCOPE Short clauses today. The gated interactive export ships. Brand fonts embedded in the export for offline fidelity (v3.4.7).	STACK Sonnet tier. Cloudflare Pages, D1, KV, Workers Secrets. Deployed from GitHub; Workers Secrets holds the keys.
---	---	---	--

PROVEN Streaming architecture across all four labs.	SHIPPED Per-scenario read scoping and consolidation, stable.	GATED Interactive export (v3.4.6), a like-for-like HTML mirror of the read; entitlement ready to swap to a paid store.
---	--	--

Trawl reviews language as [a starting point for a conversation with a professional](#). **Ancaire does not sell insurance.**

NORTH-STAR METRIC

One number the roadmap moves

Every track exists to increase a single measure of value.
We name it, then track the three levers that move it.

NORTH STAR

Confident reads delivered

Policy reads that produce an output a professional would act on. Not sessions, not sign-ups. Reads that were worth trusting.

LEVER 01

Coverage

How many lines Trawl can read. More lines, more reads it can serve.

3 → 6

coverage lines, today to GA

MOVED BY ADDING COVERAGE LINES

LEVER 02

Depth

How much of a policy Trawl takes in one read.

Clause → policy

a snippet today to the whole document at GA

MOVED BY FULL-POLICY READING

LEVER 03

Trust

The share of reads a practitioner would act on.

9 in 10

target · practitioner-rated at each gate

MOVED BY PRACTITIONER VALIDATION

DOWNSTREAM → Confident reads convert to [senior-practitioner engagement](#), the commercial result, tracked from launch.

Targets here are planning estimates to set and validate, not commitments.

INTERNAL BRIEFING

Internal roadmap

For consultants, product, and leadership. Full detail, including the seams.

THE FOUR TRACKS

Four workstreams, one destination

Everything on the roadmap belongs to one of four tracks. They run in parallel and converge on paid general availability.

TRACK A

D&O · PROPERTY · PRODUCTS LIABILITY

Coverage-line expansion

Add new lines of coverage onto the same line-agnostic engine. Each line is a knowledge-base build plus a senior-validated read, not a rewrite.

TRACK B

GATES PAID GA

Full-policy intake

Move from short clauses to whole-document reading. This is the capability that unlocks the paid product, so it gates general availability.

TRACK C

READY AT GA

Commercialization

Turn the existing quality gate into a revenue boundary: metering, licensing tiers, packaging, and the conversion path to a senior practitioner.

TRACK D

THROUGHOUT, INTO GA

Validation and testing

Design-partner cohorts per line, then a pre-GA beta of invited prospects running live UAT, then acceptance testing. Senior review is the gate, not the code.

THE PLAN AT A GLANCE

Four parallel tracks, one destination

Coverage-line expansion, full-policy intake, commercialization, and validation converge on paid general availability at the start of Q4 2027.

Beta platform testing runs the three months before GA: invited prospects conduct live UAT and unit testing as a running smoke test. In return, heavily discounted use through the beta, then one year of discounted platform pricing plus 15 additional reads per user.

Each line is a knowledge-base build plus a validation pass, not a rewrite of the engine. Full-policy intake gates GA: paid GA does not ship without it. Each new line's knowledge base draws on external senior expertise engaged on a contract basis.

The engine is line-agnostic; each line is a build, not a rewrite

What changes per line is the domain grounding: the coverage structure, the definitions that matter, the exclusions that bite, the triggers, and the questions a senior reviewer would ask.

Directors & Officers

Management liability protecting directors, officers, and the entity itself. Dense structure, well-documented disputes, and a buyer we already reach.

COVERAGE ARCHITECTURE

WHY NOW

Buyers overlap heavily with the current professional-lines audience, and the coverage-dispute patterns are well documented.

READ FOCUS

Whether Side A cover stays intact, whether the insured-versus-insured exclusion reaches a derivative claim, and whether defense costs erode the limit.

RISKS TO MANAGE

- Reads turn on structure across linked provisions, stressing the short-clause framing.
- Side A/B/C interplay and order of payments mislead when read in isolation.
- Application interplay and rescission can void cover a single clause will not reveal.

Property

First-party cover for physical loss and the income that depends on it. Long, structured policies with intricate valuation and interruption machinery.

COVERAGE ARCHITECTURE

WHY NOW

Property completes the core commercial book that sits alongside the professional lines buyers already run, so the same accounts get a fuller read.

READ FOCUS

Whether a sublimit quietly caps a major peril, whether the valuation basis matches the schedule, and whether the interruption clock leaves a gap.

RISKS TO MANAGE

- Overwhelmingly first-party, stressing the coverage-grouping taxonomy.
- Long, structured policies stress full-policy intake and cross-reference resolution.
- Sublimits and the interruption clock interact in ways easy to miss.

Products Liability

Liability for harm caused by products, released as two sub-lines that share a spine and diverge in a bounded way. The most specialized domain on the roadmap.

COVERAGE ARCHITECTURE · TWO LAYERS, ONE RELEASE

NON-MEDICAL LAYER

MEDICAL LAYER

WHY NOW

Released together for efficiency: the non-medical and medical sub-lines share a spine and diverge in a bounded, documentable way.

READ FOCUS

Whether the products-completed operations hazard is intact, whether a recall or your-work exclusion bites, and where the professional-versus-products boundary falls.

RISKS TO MANAGE

- Highest validation bar and closest to GA, so the least schedule slack.
- Medical, pharmaceutical, and regulatory interplay is the highest-stakes to get wrong.
- The professional-versus-products boundary is fact-specific and hard to call from language alone.

From a **clause** tool to a **policy** tool

Drag-and-drop upload with server-side OCR and document structuring,
so Trawl reads whole policies rather than pasted clauses.

HALF ONE

Clean-input pipeline

Upload, OCR, and structure a document into clean, section-mapped text before a single model token is spent.

HALF TWO

Analysis at longform policy scale

The running read, operating across a whole policy: section-scoped, context-carrying, consolidated into one read.

Full-policy intake gates GA. Paid GA does not ship without it.

Why server-side, not client-side

Robustness

Scanned, image-only, and hundred-page policies need real OCR and layout analysis. Browser-side OCR fails on exactly the large documents that matter most.

Token economy

Strip boilerplate, de-hyphenate, reflow, and scope the read before spending a model token. That cleanup lowers cost and raises quality, and it belongs in one controlled place.

Enterprise fit

Prospective users require an audit trail, access controls, a DPA, and a defined retention policy. A server-side pipeline can provide all of that.

THE HONEST TRADEOFF

Documents transit Ancaire infrastructure and, for scanned files, a third-party OCR service. For insurance documents that is a real data-handling responsibility.

TURNED INTO A SELLING POINT

Ephemeral encrypted storage, zero-retention OCR under a DPA, encryption in transit and at rest, and a clear data-handling disclosure.

This capability requires an update to Ancaire's Privacy Policy tied to the feature, and a review with the firm's outside counsel, before public release.

One controlled path, upload to read

Accept PDF, PNG, JPG, TIFF. One clean input contract keeps the read calibrated. Mixed PDFs, where structured text overlaps with scanned image content, carry the highest cost and risk, and are triaged with the most care. The architecture shown is planned, not yet built, and is subject to change under the conditions and constraints of development and testing.

The running read, one scale larger

The read already scopes and consolidates per scenario. A full policy is that same pattern, applied across a whole document.

01

Chunk without losing context

Read a long policy across sections without dropping the cross-references that connect them.

02

Carry shared context

Definitions and declarations travel as shared cached context, so an exclusion is read against the terms it uses.

03

Consolidate to one read

A multi-section read becomes one coherent document read rather than a pile of clause reads.

KEEPS IT AFFORDABLE

Prompt caching on the shared context (definitions, declarations, the line knowledge base) holds the cost of a full-policy read down.

RISK TO UNIT ECONOMICS

A whole-policy read runs on the order of 100x a clause read, roughly \$4 to \$10 in API processing for one policy. Architecture can reduce it, and the value proposition holds: reads convert to paid engagements that offset software cost, and a paid licensing model lands at GA.

Beta, GA-ready, headline

Turn the gate we built into a revenue boundary

The export already runs behind an authorization endpoint that checks entitlement. Commercialization builds that boundary out.

Individual, Team, Enterprise

INDIVIDUAL

Practitioner

A single seat for a broker, risk manager, or coverage counsel. Metered read allowance with full-policy reads counted heavier, or an unlimited option at the top of the tier.

TEAM

Practice

Per-seat at a lower rate, with shared clause libraries and playbooks, an admin view, and pooled allowances. The natural land-and-expand step from a single champion.

ENTERPRISE

Enterprise

Carrier, large brokerage, or corporate risk. Custom ACV with SSO, DPA and zero-retention OCR, API access, custom lines and playbooks, higher or unlimited full-policy volume, and dedicated support.

Inference is not the constraint

4¢–10¢

Short-clause read

Cacheable knowledge base; a couple thousand fresh tokens in, a few thousand out.

\$4–\$10

Full-policy read

Tens of thousands of fresh tokens, a larger multi-section output, several passes for long policies.

≈0¢–5¢

OCR

Digital PDFs extract for near-zero; scanned files run cents per document.

Clause reads stay near-costless; full-policy reads are the meaningful cost of goods, which is why the full-policy allowance is metered and capped. Pricing is value-based, anchored to catching a coverage gap.

MARGINS	Margins stay strong at typical usage, and the read cap protects them under heavy use.
ARCHITECTURE	The architecture could be optimized further to trim full-policy read cost, but that cost stays trivial against follow-on engagement, licensing, and capped reads. Any such optimization would call for specialized software-development support.

Every figure is a planning estimate to validate, not a committed price. Unit economics last evaluated 9 July 2026 against then-current Claude API pricing; Ancaire's choice of models and Claude API pricing are subject to change at any time without notice.

Anchored to the legal-AI envelope

The closest analog is clause-by-clause risk scoring with a visible reasoning trail, applied to insurance coverage language rather than commercial contracts.

THE MARKET ENVELOPE

Individual seats Spellbook to LegalOn	\$99-\$550 / user / mo
Mid-market focused review platforms	\$300-\$600 / mo
Enterprise e.g. Luminance	custom, from ~\$50k / yr

RECOMMENDED BANDS

Individual	\$150-\$250 / seat / mo Up to 10 full-policy reads / user / mo, overage metered
Team	\$120-\$200 / seat / mo, min seats Pooled at 10 full-policy reads / user / mo
Enterprise	custom ACV from ~\$50k / yr Higher or unlimited full-policy volume

PRICING RATIONALE

Meter full-policy reads separately in every tier and use that allowance as the primary expansion lever, since it is the most expensive to serve and the most valuable to the buyer.

Narrower than a general contract tool, but in a vertical where a single missed exclusion can be a seven-figure event, which supports the mid-to-upper end of the envelope.

All figures are planning estimates to validate, not committed prices. Unit economics last evaluated 9 July 2026 against then-current Claude API pricing; Ancaire's choice of models and Claude API pricing are subject to change at any time without notice.

Owned and managed, not surprises

Internal only

Engineering seams

Known debt to reconcile before GA

Parallel-implementation drift

Trawl is a partial fork of shared lab patterns.

→ Reconcile the shared machinery before GA.

Soft export gate

The export is assembled client-side today.

→ Move generation server-side before it is a paid boundary.

Coverage-grouping fit

The first-party and third-party split fits some lines poorly.

→ Review the taxonomy as a whole, not per line.

Model-version drift

The labs run on an earlier Sonnet than the current release.

→ Migrate to the current Sonnet with a per-line re-run.

Risks

Managed, not surprises

Full-policy chunking GA-CRITICAL

Holding cross-section context is the hardest problem.

→ Prototype early with practitioners on real outputs, iterating to calibrate the read to how policies are built.

Rendering sanitization

Intake widens the input surface from a clause to a document.

→ Treat a sanitization audit as a GA gate.

OCR vendor and data posture

A third-party OCR service is an external dependency.

→ Isolate it, run zero-retention under a DPA, keep a fallback.

Validation is the critical path GA-CRITICAL

Every launch date is gated by senior review, not code.

→ Protect the Products quarter: highest bar, least slack.

Trawl

Product roadmap to general availability

On the name: a trawl is a net drawn slowly through deep water to bring up what lies below. Trawl reads policy language the same way, surfacing what is worth seeing.

WHAT TRAWL IS

Trawl reads insurance policy language clause by clause.

It returns a structured, reshapeable read, anchored to the language:

gaps broad exclusions closer looks strengths

TWO OUTPUTS

- HTML Interactive export: a like-for-like HTML mirror of the running read, essentially a data-visualization dashboard. Gated behind a pending paywall; it ships as a paid capability.
- PDF Assessment: a board-ready PDF for a client or board conversation.

POSSIBLE GAP

Cover the insured would expect that the language may not provide.

e.g. Notice provision may require reporting inside the policy period only.

BROAD EXCLUSION

An exclusion drafted wider than its purpose, cutting into cover.

e.g. Contractual-liability carve-out reaches beyond assumed obligations.

CLOSER LOOK

Language whose effect is ambiguous and worth confirming before bind.

e.g. Definition of Claim is narrower than the insuring agreement implies.

STRENGTH

A provision that works in the insured's favor.

e.g. Defense costs sit outside the limit, preserving indemnity.

BUILT-IN CONVERSION FUNNEL: FROM READ TO ENGAGEMENT

* The portal handoff requires explicit opt-in before any detail is shared, and your inputs are used only to generate your read.

THE OPPORTUNITY

Reading coverage language is slow, manual, and high-stakes

Every policy hides gaps and exclusions in dense language, and the senior expertise to find them is scarce. These are the buyers who feel it.

PERSONA	WHY THEY ENGAGE	WHY THEY PAY	RETURN ON THEIR TIME
Financial Sponsors	Portfolio risk-transfer diligence, and a stress test of their broker's work	Catch coverage gaps before a deal closes	Senior review compressed to minutes
Brokers	Sharper renewal and placement advice	Win and defend accounts with rigor	More accounts reviewed per week
Risk Managers	Read their own tower with confidence	Fewer surprises at claim time	Board-ready answers, faster
CFOs	Quantify uncovered exposure	Protect the balance sheet	Clarity without a consulting spend
General Counsels	Test coverage language before bind	Reduce dispute risk	Priority areas for outside coverage counsel, cutting unnecessary hourly billing

Trawl brings senior-grade coverage-language analysis to the point of work.

THE PRODUCT, SIMPLY

Give it policy language, get a read you can act on

1 Give it the language

Paste a clause today, or upload a whole policy at general availability.

2 It reads against expertise

Trawl checks the language against a disclosed, line-specific knowledge base built by senior practitioners.

3 Act on the read

Findings arrive grouped as gaps, exclusions, closer looks, and strengths, and compile into two outputs: an interactive HTML export and a board-ready PDF assessment.

WHAT YOU GET: THE RUNNING READ

lens

risk

finance

legal

POSSIBLE GAP

Cover the insured would expect that the language may not provide.

e.g. Notice provision may require reporting inside the policy period only.

BROAD EXCLUSION

An exclusion drafted wider than its purpose, cutting into cover.

CLOSER LOOK

Language whose effect is ambiguous and worth confirming before bind.

e.g. Definition of Claim is narrower than the insuring agreement implies.

STRENGTH

A provision that works in the insured's favor.

e.g. Defense costs sit outside the limit, preserving indemnity.

two outputs: interactive HTML export, board-ready PDF assessment

Trawl reviews language as a starting point for a conversation with a professional. Ancaire does not sell insurance.

WHY IT IS DIFFERENTIATED

Trust and depth, not novelty nor attestation, and never a coverage opinion.

01 Disclosed expertise

Reads against disclosed, line-specific knowledge rather than open-ended AI priors.

02 Reasoning shown

A structured, anchored read rather than a black-box answer, so a professional can check it.

03 Senior-validated

Built and validated by senior practitioners in a real advisory firm, not a general tool.

CARRIER SIDE

04 Sorts by decision, not description

The carrier read grades each request by exposure (resist, scrutinize, negotiate, concede) and weighs it against the applicant's real controls, the underwriter's actual question.

Trawl from the underwriter's seat

Every coverage negotiation has two sides. Carrier Evaluation reads a broker's requests from the carrier's, and sorts each by how to respond, graded by exposure to the book.

ONE SURFACE, THREE MODES

- Clauses

BROKER, RISK MANAGER, PE SPONSOR, GC
- Clauses plus Policy Read

BROKER, RISK MANAGER, PE SPONSOR, GC
- Carrier Evaluation

CARRIER

Reuses the Trawl console, running read, and knowledge base. What changes is the reader's seat, and access is walled to the carrier by a server-enforced entitlement.

THE BOUNDARY

Decision support for the underwriter, not an underwriting or pricing authority. It does not attest and it does not price.

SORTED BY RESPONSE, GRADED BY EXPOSURE

HIGH TO LOW

Resist HIGHEST EXPOSURE	Increases risk to the book. Push back, decline, or counter.
Scrutinize HIGH EXPOSURE	Expands exposure. Needs real underwriting judgment first.
Negotiate MODERATE EXPOSURE	Grantable with a condition, a sublimit, or a trade.
Concede LOWEST EXPOSURE	Low-risk to grant, and often competitively smart to give.

Reading the request against the controls

A request looks different when you can see the applicant's actual controls.

LEFT LANE

The broker request list

Paste the requests, upload the broker's request tracker (Word, Excel, or PDF), or type a single request to stress-test it with no list at all.

RIGHT LANE · OPTIONAL

The client application

Load the client's own application or controls questionnaire (a cyber new-business app, a renewal, a privacy supplemental). Read as control context, not as a policy.

Applications are sensitive. The tool confirms the client is aware and extracts everything locally, never uploading the document.

WHAT THE APPLICATION CHANGES

Re-buckets, and names the control

A ransomware sublimit request can move from scrutinize to negotiate when the application shows tested backups and enforced MFA. The read names the control that moved it.

Attaches conditions and questions

Grant subject to the control, or confirm it before binding. The play comes with the questions to ask first.

Flags control gaps on its own

Surfaces weak, absent, or unverified controls as findings the underwriter should see, even when no request touches them.

WHAT IT UNLOCKS A carrier distribution channel that pays in platform revenue and in a standing supply of forms and coverage consultation that keeps the knowledge base current. **Next step:** per-carrier knowledge base instances, a carrier's own forms and positions rather than the shared base.

NORTH-STAR METRIC

One number the roadmap moves

Every track exists to increase a single measure of value.
We name it, then track the three levers that move it.

NORTH STAR

Confident reads delivered

Policy reads that produce an output a professional would act on. Not sessions, not sign-ups. Reads that were worth trusting.

LEVER 01

Coverage

How many lines Trawl can read. More lines, more reads it can serve.

3 → 6

coverage lines, today to GA

MOVED BY ADDING COVERAGE LINES

LEVER 02

Depth

How much of a policy Trawl takes in one read.

Clause → policy

a snippet today to the whole document at GA

MOVED BY FULL-POLICY READING

LEVER 03

Trust

The share of reads a practitioner would act on.

9 in 10

target · practitioner-rated at each gate

MOVED BY PRACTITIONER VALIDATION

DOWNSTREAM → Confident reads convert to [senior-practitioner engagement](#), the commercial result, tracked from launch.

Targets here are planning estimates to set and validate, not commitments.

Wider coverage, deeper reads, to paid GA

Paid general availability at the start of Q4 2027, with individual and enterprise licensing and whole-policy analysis.

Recurring licensing, healthy margin

RECURRING LICENSING

Individual and enterprise seats, in line with comparable professional-AI tools.

HEALTHY GROSS MARGIN

Clause reads are near-costless; full-policy reads are the real cost and are capped by metered allowances, so gross margin stays strong at typical usage and holds as usage grows.

Figures are planning estimates anchored to comparable tools; final pricing is validated with design partners.

Cents to serve, hundreds to sell

CLAUSE READ · TODAY

cents

A pasted clause read against a cached, line-specific knowledge base.

FULL-POLICY READ · AT GA

\$4 to \$10

A whole policy read section by section, with shared context cached.

SEAT PRICE

\$100s / mo

Individual seats in the low hundreds; enterprise from tens of thousands per year.

≈1.3 MB

WHOLE SITE, TRAWL INCLUDED

HOW SMALL IS THAT?

Smaller than a single phone photo, and over 700 copies fit in one gigabyte. The browser does the rendering, so the whole site runs on Cloudflare's free plan, about \$80 a year for the domain. Lean, fully portable, and trivially adaptable.

Full-policy analysis → Headline of GA → Metered paid licensing

The costliest reads are the ones customers pay for. The full-policy allowance is metered as the expansion lever, so gross margin holds as usage grows.

WHY ANCAIRE WINS HERE

Expertise and trust, encoded into a product

MOAT 01

01

Senior expertise

A senior-led advisory firm with real insurance and risk-transfer depth, not a general software vendor.

We can tell a sound read from a plausible one.

MOAT 02

02

Distribution

Existing relationships across the broker, carrier, and risk-manager community Trawl serves.

A warm path to the buyers Trawl is built for.

MOAT 03

03

Proprietary IP

The M² framework and the labs' proprietary knowledge bases, built over years of engagements.

Trawl is one instrument on the platform, not a feature.

Expertise and trust, encoded into a product and hard to copy. Trawl is where that moat meets the market first.

COMPETITIVE POSITION

Qumis built a lawyer's tool. Trawl is a broker's instrument.

Backed by a senior risk and resilience practice. In this market, the broker's seat is the one that sees the whole board.

THE ONE CREDIBLE COMPETITOR	
Qumis, an attorney-trained coverage AI, has raised 6.75M dollars and works with named national brokers. We take it seriously. We are built for a different seat at the table.	
Founded	2022, attorney-led
Raised	6.75M dollars
Brokers	NFP, Brown and Brown
Lines	Cyber, D&O, E&O

WHY WE ARE DIFFERENT

WHO BUILT IT	THE MODEL	THE KNOWLEDGE BASE	THE PROOF
Built from the broker's seat	Senior-enabled, not self-serve	Market nuance, not case law	Lightweight by design
Designed and led by a practicing broker building the knowledge base itself. A lawyer reads a policy for what it says; a broker reads it for what it means in a live market.	The front edge of a senior-led practice. The tool surfaces the read; a senior practitioner stands behind it when the stakes justify it. A doorway to judgment, not a replacement for it.	Annotated by a broker, from the market, for the lines where wording moves fastest: cyber, Technology E&O, and MPL. The moat is who is annotating the wording.	1 person • 1.3 MB • 1 month
			A working, gated, multi-lab platform. Capital efficiency as evidence of a team that ships.

THE COMPETITIVE FIELD

One quadrant is defensible, and only Trawl stands in it

The market is racing toward interpretive advisory. Only Trawl pairs it with a senior-led practice behind the tool. That top-right corner is the defensible one, and we are the only one standing in it.

CAPITAL EFFICIENCY

Qumis, to get here

6.75M

Trawl, so far

1 • 1.3MB • 1

Price what the same dollars do behind a team that already moves this fast.

EXECUTION AND DECISION VELOCITY ARE INTERCONNECTED

One operator, no translation loss

SHIPPED VERSIONS · ANCAIRE LABS

225+

May 26th to July 14th, 2026

More than thirty a week, every week, for seven weeks.

The practitioner is the developer

The person who knows what a sound coverage read should do is the person who builds it. No translation loss between intent and code, and no handoff latency between deciding and shipping.

Expertise is the filter and the accelerator

Velocity without judgment is churn. A version ships only when domain expertise confirms it advanced a feature worth developing, so speed compounds into a better instrument rather than noise.

Velocity here is a proxy for how fast the platform learns: build, validate against real expertise, ship, repeat.

DISCLOSURE

What Trawl Lab is, and is not

Trawl Lab is a discovery tool from Ancaire's Risk and Resilience Operations practice. Ancaire does not advise on, solicit, negotiate, place, transact, or sell insurance, and is not acting as your insurance broker, agent, or producer.

Nothing here is legal advice, a coverage opinion, or a determination that any policy does or does not cover any matter. Every observation is a general review of policy language offered only for discussion.

The review reflects only the text you provide and a general best-practice knowledge base. It is not a complete review of any policy and does not account for endorsements, declarations, schedules, or terms you do not paste, and actual coverage depends on the full policy, the carrier, the facts of a claim, and applicable law.

Do not rely on Trawl Lab to buy, bind, renew, or maintain coverage. Confirm anything that matters with your licensed broker or carrier, and, where useful, with our Risk and Resilience Operations practice. Using Trawl Lab creates no broker, agency, or attorney relationship.

THE ASK

Where we go from here

THE ASK

Connect with Ancaire on the overall investment case.
Trawl is a small subset of what makes the firm
distinctly capable: senior expertise, unique
experience, and proprietary IP.

Senior-grade coverage-language analysis, at the point of work.

Trawl

ancaire.ai · Ancaire Labs

Trawl reviews language as a starting point for a conversation with a professional.
